

IDM PowerRole

for Micro Focus Identity Manager

Lower the cost of your Role Based Access Control (RBAC) project and shorten the integration process of your role model

PowerRole is an Add-On to the NetIQ Identity Manager. It automates the import of existing roles, resources and role assignments. Role assignments can be scheduled with start and end date. The role assignments can be done with or without executing the approval processes. This allows the import of initial role models or mass modification of roles, resources and role assignments within minutes.

Building a role model is a burdensome task and takes a lot of time. Therefore you would appreciate to load it quick and easy into your existing identity manager environment. PowerRole allows the automatic import of your complete role model from a CSV text file. New role models or changes and extensions on existing role models can be loaded very efficiently this way.

When implementing a new role model, existing access rights of employees must be transformed into role assignments. This is a time-consuming and laborious process. PowerRole allows loading and assigning roles to employees from a CSV text file. The scheduled assignment of roles is supported by using start and finish time stamps.

This way initial role assignments of hundreds of roles to thousands of employees can be done within minutes. Thanks to the possibility to load role assignments either in overriding or extending mode, also mass mutations can be performed very easily.

Features:

PowerRole adds the following functions to the existing Identity Manager:

- ▶ bulk import of role models from CSV files
- ▶ bulk import of role assignments from CSV files
- ▶ scheduled activation or termination of role
- ▶ assignments override or extend existing role assignments

System requirements:

PowerRole requires the following modules:

- ▶ Identity Manager v3.0 or higher
- ▶ Role Based Provisioning Module
- ▶ Integration Module for Tools
